## THE COUNCIL FOR TOBACCO RESEARCH-U.S.A., INC.

110 EAST 59TH STREET NEW YORK, N. Y. 10022 (212) 421-8885

Application for Research Grant (Use extra pages as needed)

1. Principal Investigator (give title and degrees):
Charles R. Shaw, M.D. Biologist; Chief, Section of Medical Genetics and Professor of Biology

Institution & address:

2. Institution & address:

The University of Texas at Houston M. D. Anderson Hospital and Tumor Institute 6723 Bertner Avenue Houston, Texas 77025

3. Department(s) where research will be done or collaboration provided:

Department of Biology, Section of Medical Genetics The state of the s

4. Short title of study:

#Hydrocarbon Metabolizing Enzymes and Lung Cancer

- 5. Proposed starting date: January 1, 1974
- 6. Estimated time to complete: Three (3) years
- 7. Brief description of specific research aims:
  - a) To clarify the relationships between the variations in the human population of certain of the carcinogen-metabolizing enzymes and the occurrence of lung cancer.
  - b) To modify the method, developed in our laboratory, for assay of aryl hydrocarbon hydroxylase in human subjects, for adaptation as a clinical laboratory procedure.
  - To compare activities of these carcinogen-metabolizing enzymes in lung: cultured lymphocytes, and other tissues.
  - To investigate the effects of inherently different levels of these enzymes on rates of incorporation of carcinogen metabolites into cell components and the effects of these metabolites on cell activities, particularly DNA repair mechanisms and in vitro transformation.

8. Brief statement of working hypothesis:

Most of the hydrocarbon carcinogens are converted in the target cell to the reactive epoxide form of the molecule, by aryl hydrocarbon hydroxylases (AHH). This is an inducible enzyme, and the degree of inducibility is genetically variable in man. We hypothesize that the level of AHH determines, at least in part, susceptibility to chemical carcinogenesis. Our preliminary studies in man support this hypothesis

Details of experimental idesign and procedures (append extra pages as necessary) The basic design of the clinical research is to measure AHH activity and inducibility in lung cancer subjects and their families, employing the lymphocyte culture system developed in our laboratory (Busbee et al., 1972). This assay has been shown to be a competent indicator of the general, hereditarily-determined inducibility of this enzyme in the individual. In the normal population there are three distinct groups, having low, intermediate, and high levels of inducibility (Kellermann et al., 1973a). Preliminary studies of fifty lung cancer cases indicate that only persons with intermediate and high levels are susceptible to this disease. Larger and more detailed studies are indicated, to determine if those with highest AHH activities are mone susceptible than intermediates (earlier onset, gneater severity of disease, etc.), and which types of bronchogenic carcinoma are effected through the AHH system. It appears that the oat cell carcinoma is in a different category. Family studies of the lung cancer subjects are indicated, to clarify cause-effect relationships. Such studies will show whether the subjects fall into the expected hereditary groups, or whether their increased inducibility could be a result of the cancer. The latter is unlikely, but needs to be examined.

Lung tissue, both normal and diseased, will also be studied, by organ and tissue culture, to correlate enzyme activities with that in cultured lymphocytes. Other enzymes will also be studied in these tissues, particularly those which effect the breakdown of the epolides and especially the epoxide hydrase. Preliminary studies in our laboratory suggest that the epoxide hydrase is not a rate-limiting enzyme in hydrocarbon metabolism (Kellermann et al., 1973b).

To investigate effects of varying levels of AHH activity in the cell, cell cultures will be established from subjects with low and high levels. Rate of incorporation of labeled hydrocarbon metabolites into these cultured cell lines will be determined, and if possible, localization of binding sites will be identified. Further, effects of incorporation of these metabolites on DNA repair mechanisms will be measured in collaboration with Dr. Roger Hewitt of this depantment. These studies will be directed mainly to previously characterized DNA repair enzymes.

Efforts will be made to develop the AHH assay system as standardized clinical laboratory procedure. This has a number of obvious applications: as a diagnostic tool, in mass screening procedures to determine susceptibility to lung cancer and possibly other chemically induced cancers, and to study gene frequencies among various human populations. Our studies indicate that approximately Half of the people in the U.S. population having low AHH inducibility, carry an extremely low risk for lung carcer due to smoking. The higher-risk individuals may be identified and counselled appropriately.

10. Space and facilities available (when elsewhere than item 2 indicates, state location):

The laboratories of the principal investigator are located on the fifth floor of the Research Institute Wing of The University of Texas M. D. Anderson Hospital and Tumor Institute. They consist of five laboratories totaling 1,600 square feet, with a walk-in cold room and four adjoining offices. They are well equipped for general biochemistry, and major items include a Nuclear-Chicago Unilux IIA Scintillation Counter, two Gilford recording spectrophotometers (Models 2400 and 240). Beckman L-4 preparative ultracentrifuge, 12 complete sets of starch gel electrophoresis apparatus, two Sorvall RC-2 B refrigerated high speed centrifuges, an incubator, and a large amount of column chromatography apparatus.

Additionally available for our use located in adjoining areas of the Department of Biology are a glassware preparations room, a walk-in incubator, and a variety of other biochemical instruments available for part-time use. This includes an Aminco-Bowman spectrophotofluorometer, which is the main instrument employed in the present investigation.

The clinical facilities of the M. D. Anderson Hospital and Tumon Institute are available for this study. The M. D. Anderson Hospital and Tumor Institute is a categorical institution for the study and treatment of neoplastic diseases. It has approximately 300 inpatient beds, and an addition is presently under construction which will add another 300. Patients are seen by referral only and the outpatient clinic sees approximately 6,000 referrals annually.

11. Additional facilities required:

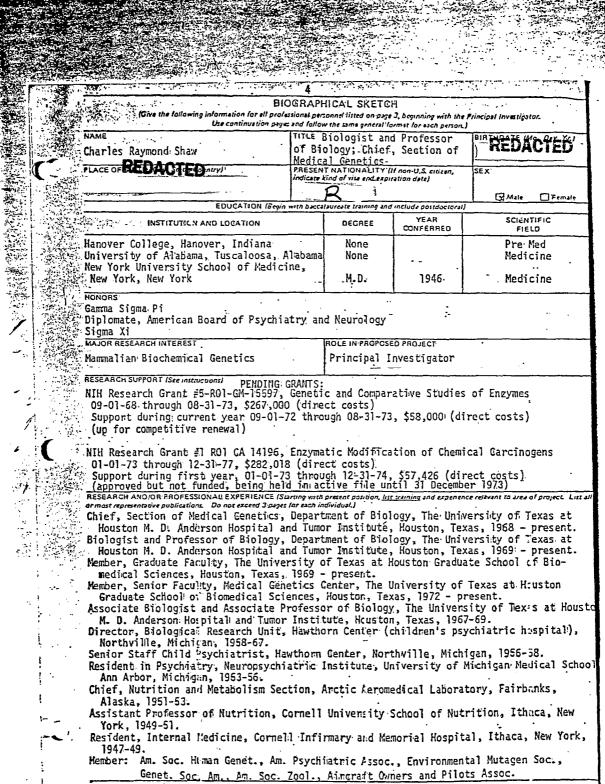

Our pressing need for this project is for several items of equipment. A spectrophotofluorometer is, as noted above, the instrument employed for measuring the hydroxylase activity. We are presently using an instrument in the laboratory of Dr. Roger Hewitt, and his instrument is heavily used and at times not available to us. A CO2 incubator is needed for the organ and cell culture work. For preparation of lymphocytes and cell cultures a refrigerated centrifuge is required. A phase-optics microscope is needed to evaluate the condition of cultured cells and to count the cells before and after culture.

Otherwise, the present facilities and equipment are quite adequate for this project.

12. Biographical sketches of investigator(s) and other professional personnel (append):
Charles R. Shaw, M.D., Elroy Cantrell, Rh.D., and Gottfried Kellermann, Rh.D.

(Please see attached)

13. Publications: (five most recent and pertinent of investigator(s); appending, and provide reprints if available).

Salaries are budgeted in accordance with the Institution's Personnel Pay Plan. Fringe Benefits include employer contributions to Social Security, Workmen's Compensation Insurance, Unemployment Compensation Insurance, and employee's insurance program. These costs are all uniformly charged as direct costs to all grants and contracts.

Increases requested for personnel in subsequent years have been computed in accordance with the established institutional policy, and include a one-step increase for all employees in all additional years of the project.
